APIs: What are they and How can they benefit you?

History

Back in 1996 the only way to register a trademark was to file a paper application!

Several years later the **online services** were introduced

- Access through the **EUIPO** portal
- Designed around the needs of the users

APIs are another step forward in terms of innovation and modernising our online services!

What is an API?

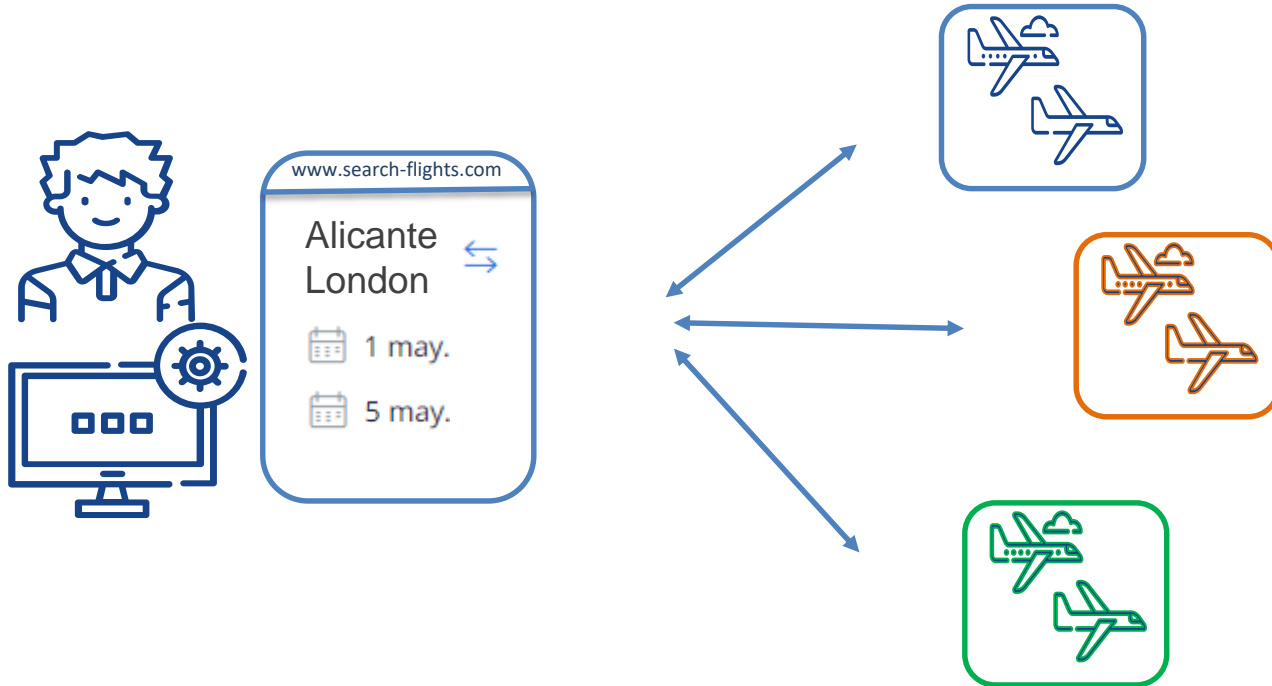

Application programming interface
a piece of technology that allows two different systems to “talk”/”act” to each other

APIs: example – flight searches

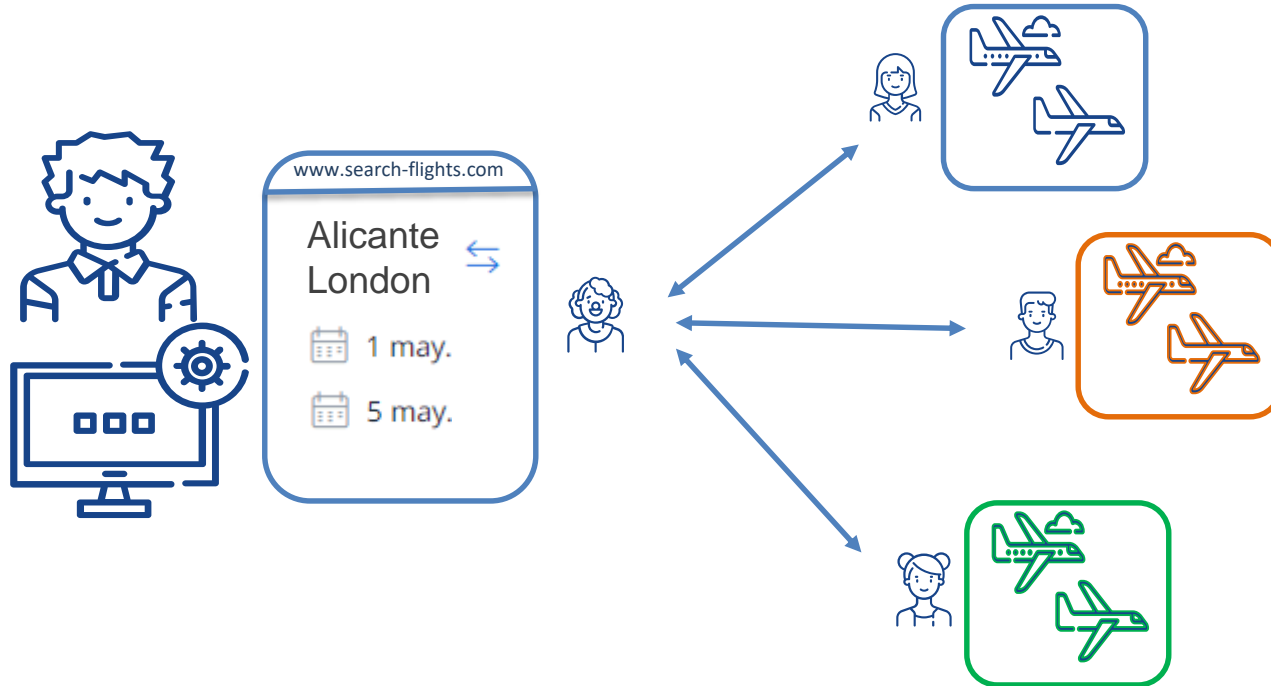

APIs are everywhere!

APIs: example – flight searches

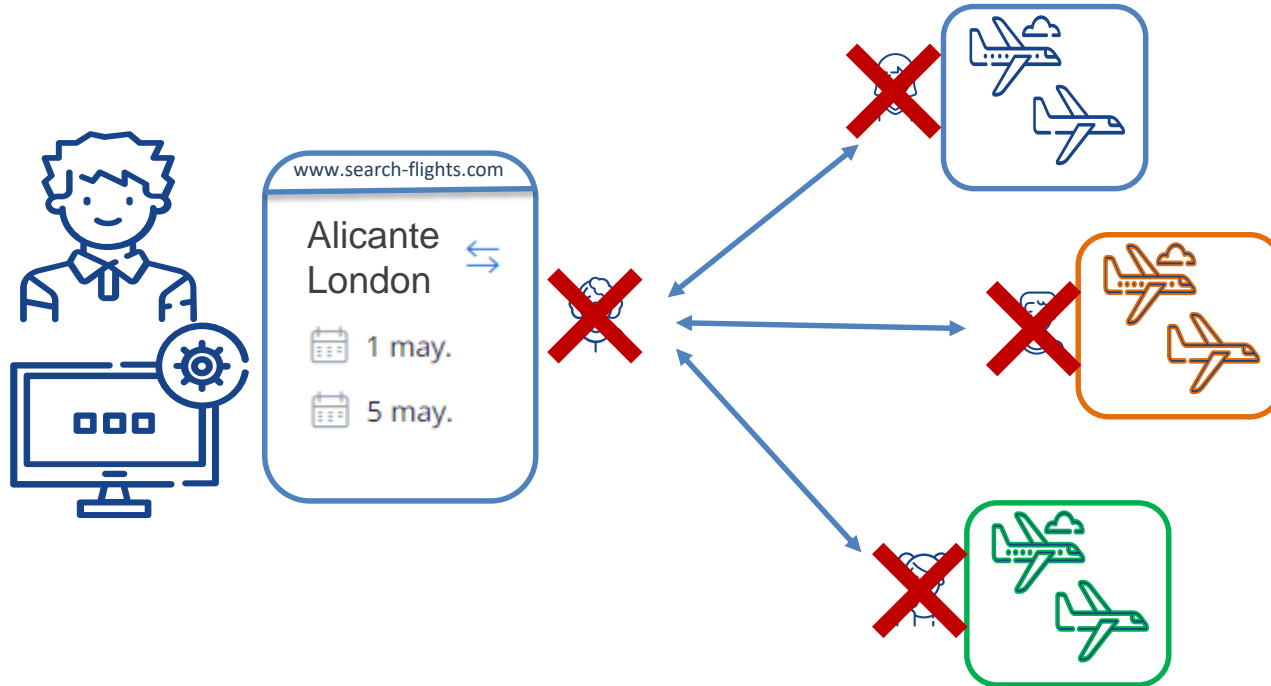

APIs are everywhere!

APIs: examples

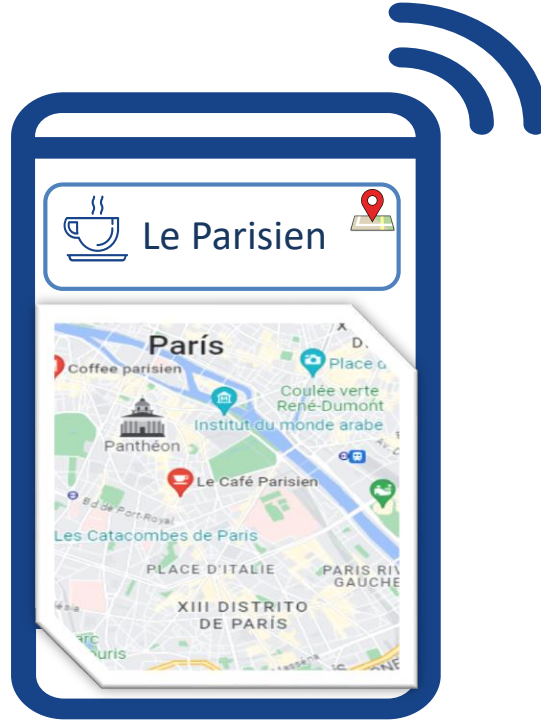

APIs are everywhere!

APIs: examples

APIs are everywhere!

APIs: examples

APIs are everywhere!

Why? – The background

The **online services** were not ready to work with third-party tools.

Users found other ways to access the data, causing an **adverse impact** on our infrastructure.

The need was growing day by day. The EUIPO decided to define an API initiative in the context of **Modernized EUIPO Online Platform**

Some use cases in the field of IP

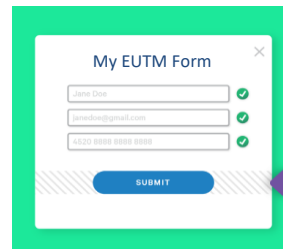

APIs in the field of IP

EU trade mark applications

Without APIs: current situation

- Customers with a large portfolio usually have their own software.
- They tend to prepare the application in their system.
- They then repeat the process in the Office's online application form.

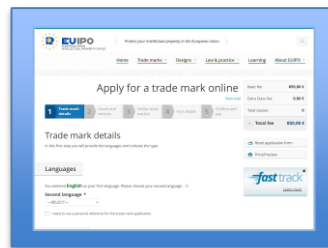

Customer Form

A screenshot of a web form titled "My EUTM Form". It features three input fields: "Jane Doe" with a green checkmark, "jane.doe@gmail.com" with a green checkmark, and "4520 8888 8888 8888" with a green checkmark. Below the fields is a blue "SUBMIT" button. The form is enclosed in a light blue border.

Create EUTM

EUIPO – online EUTM application form

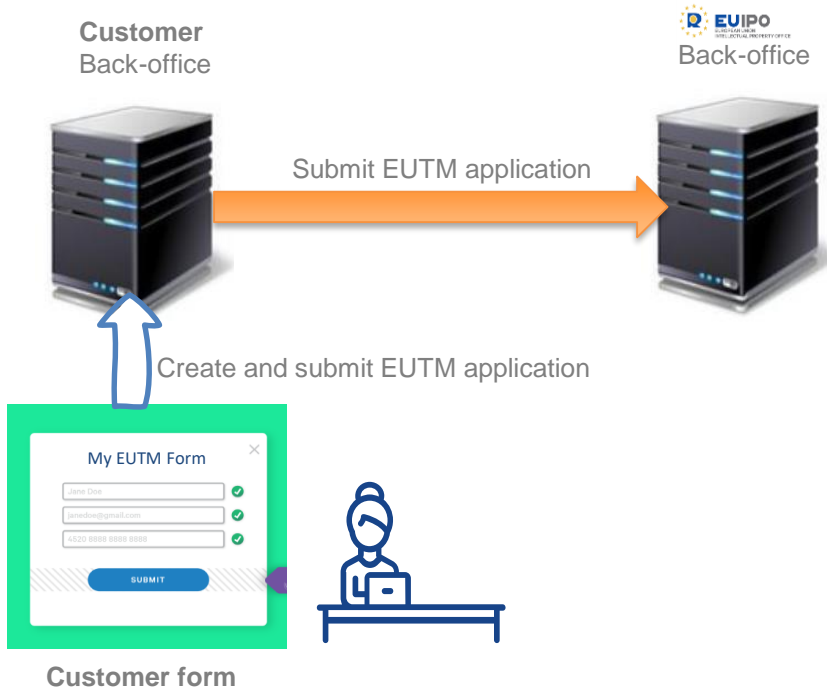

A screenshot of the EUIPO online application form. The header includes the EUIPO logo and navigation links: Home, Trade marks, Design, Languages, Services, About EUIPO. The main content area is titled "Apply for a trade mark online" and includes a "Trade mark details" section with a "Submit" button. There is also a "Languages" section and a "fast track" logo.

Submit EUTM application

EU trade mark applications

APIs: potential improvements

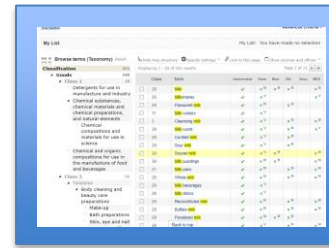

- The customer can prepare the application in their own software and then submit it directly to the Office.

Goods and services classification

Without APIs: current situation

- Trade mark application may require the use of harmonised terms.
- This information could be provided by the TMclass website or third party tools.
- Context switch: customer's software and classification tool.

TMclass/other tools

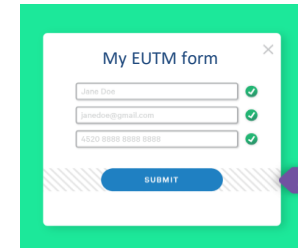

Class	Goods	Services	Class	Goods	Services
01	Engines for land vehicles		42	Designs	
02	Engines for sea vessels		43	Travel agencies	
03	Engines for aircraft		44	Medical apparatus, electric, for electrotherapy, electrodiagnosis and electrotherapeutics	
04	Engines for tractors		45	Legal services

SUBMIT

Fill in G&S classification

Goods and services classification

APIs: potential improvements

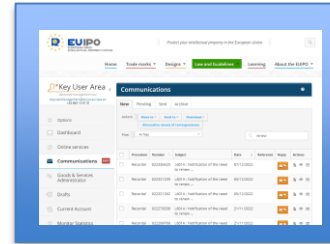

- Customer can validate G&S classification in their own software.
- Search the harmonised database while preparing the application.

Registered trade mark analysis

Without APIs: current situation

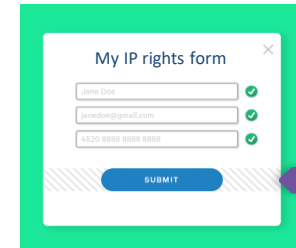

- Planning out IP protection requires analysis of previously registered IP rights.
- Representatives may use the Office's eSearch tool available on the website.
- This is a laborious manual task.

EUIPO eSearch

Many searches ...

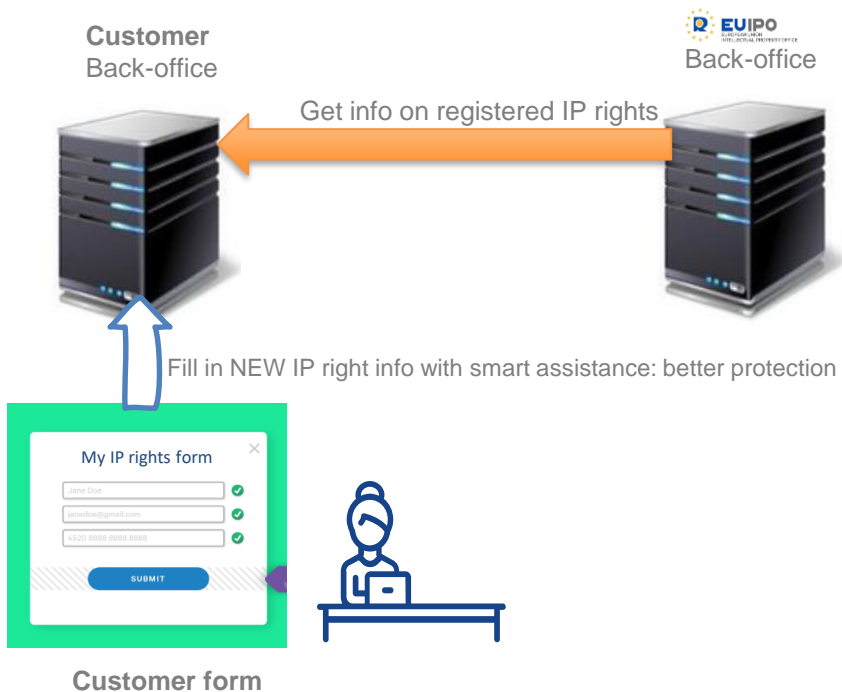

Customer form

Fill in IP rights information

Registered trade mark analysis

APIs: potential improvements

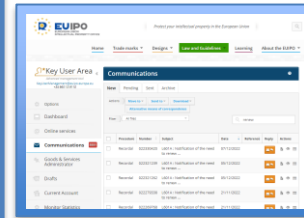

- Customer can retrieve information on registered IP rights automatically in their own software.
- They can receive updates on registered IP rights automatically (cancellations, appeals, etc.).
- They can use this information and enrich it with data from other sources to make decisions on the protection of future IP rights.

Examination deficiencies

Without APIs: current situation

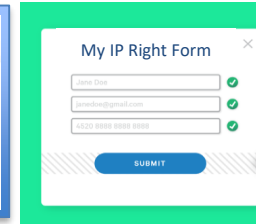

- Deficiencies notifications are usually received in User Area.
- A notification is a PDF document with the list of deficiencies.
- Customer answers via an electronic form in the User Area.

User Area -
communications

Read deficiencies
notifications

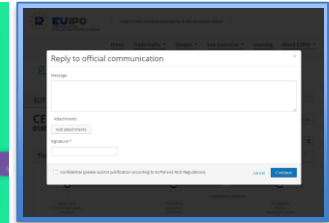

Customer form

Fix IP right

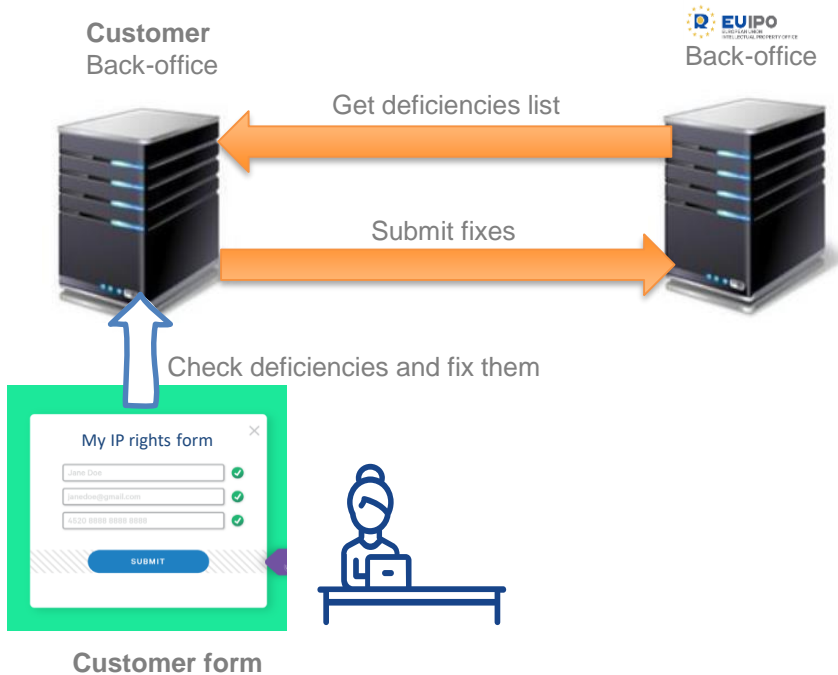

Reply to official
communication

Submit fixes

Examination deficiencies

APIs: potential improvements

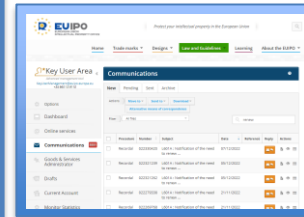

- Notifications could be made available in customer's software.
- Deficiencies could be shown as a list in a form in the customer's software.
- Customer can answer and submit the fixes to the Office directly from the form.

Renewals

Without APIs: current situation

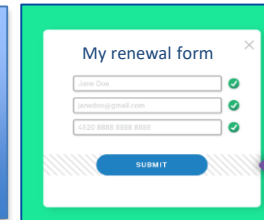

- Notifications on pending renewals are usually received in User Area.
- Notifications are sent 6 months in advance before renewal period starts.
- Customers with large portfolios usually have their own software.
- Renewal application form only available on the EUIPO website.

User Area -
communications

Read renewal
notifications

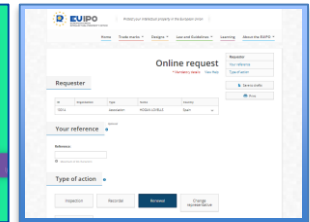

Customer form

Update IP rights

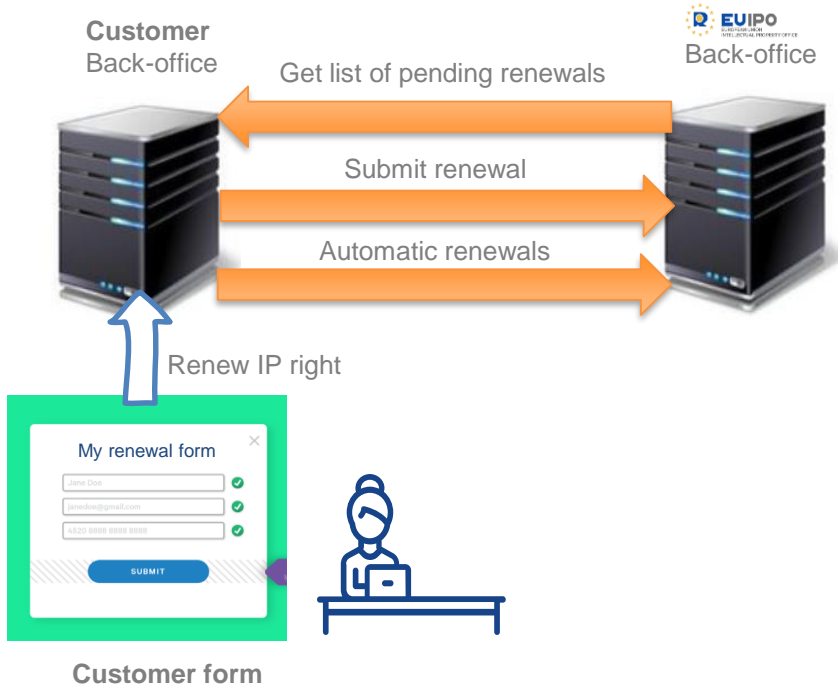

Online renewals
form

Submit renewal

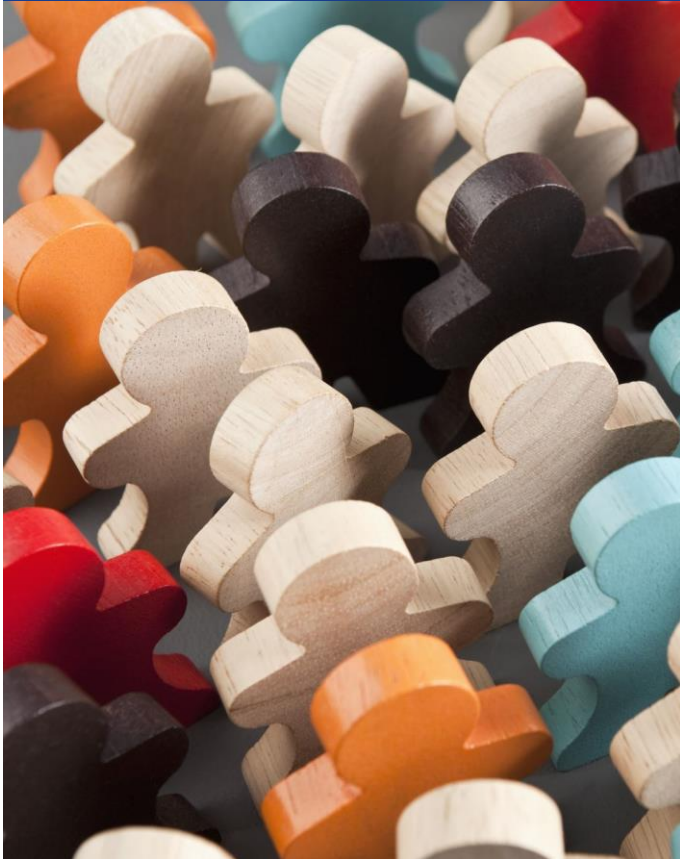

Renewals

APIs: potential improvements

- List of IP rights pending renewal available in the customer's own software.
- Customer could have a renewal form in their own software and submit the application from there.
- Customer could set specific IP rights to renew automatically.

Design together – API community

Building an API community.

Open dialog between API providers and customers.

Test environment to try out EUIPO APIs.

Customer feedback translates into improvements, priorities.

Goal: create services that provide actual value to customers.

1.0.0

REST • Online

Add or import a registered trade mark as new claim

When we are performing an application of an EUTM we have two different options for providing goods and services classification. In this guide we are going to explore both possible paths.

Providing classification in first language

The most common scenario will be **providing goods and services in the first language**. In the example down below we can see the request body for this action. Please be aware that for clarity reasons, only the relevant properties are included.

```
{
  "firstLanguage": "en",
  "secondLanguage": "es",
  ...
  "goodsAndServices": [
    {
      "classNumber": 8,
      "terms": [
        "Tableware [knives, forks and spoons]"
      ]
    },
    {
      "classNumber": 21,
      "terms": [
        "Aluminium cookware"
      ]
    }
  ],
  ...
}
```

By default, unless otherwise indicated, the terms are considered to correspond to the language specified in the **firstLanguage** property. So in this case, it is not necessary

FAQ

What languages can I use to invoke an API?

The APIs exposed by EUIPO API follow open standards and be language and platform agnostic. Any system capable of forming a JSON string and issuing an HTTP request can be used to invoke a RESTful API. It is important to note that EUIPO does not restrict the technology you use to invoke the API.

Can I get a client for an API in my language of choice?

Clients usually take the form of generated source code, in the consumers language of choice, and provide a simpler mechanism for invoking the API without the need to build validation and/or data transformation mechanisms. EUIPO API does not provide clients for testing their APIs.

If you would like to use an API client rather than crafting the JSON payload and issuing HTTP requests, the machine-readable nature of EUIPOs OpenAPI descriptors means that a client generator can be used for many programming languages - see the OpenAPI Initiative (openapis.org) project page for examples.

How does API Security work?

REST APIs use HTTP and support Transport Layer Security (TLS) encryption. TLS is a standard that keeps an internet connection private and checks that the data sent between two systems (a server and a server, or a server and a client) is encrypted and unmodified.

EUIPO offers its APIs using HTTPS protocol, which is a secure extension of HTTP using a TLS certificate.

In the request processing pipeline, authentication comes first and authorisation comes next. Authorisation only occurs after successful authentication of the request.

- Authentication: Authentication is the process of identifying whether the credentials passed along with the request are valid.
- Authorisation: Authorisation is the process of identifying whether the received request is allowed to access the requested endpoint or method.

Getting started

1 Do you have an EUIPO account?

To access our APIs you need an EUIPO account. Once you have logged in, using your account credentials there are two types of portals, Sandbox and Production, that you can access.

2 Sandbox or Production?

The Sandbox and Production portals have the same APIs. If you are new to EUIPO APIs or using a new version of an API, you should start with the Sandbox portal which gives you read/write access to test versions of our APIs using realistic sample data.

3 Register an app

After login, register your application in the 'My Apps' section. When you register an application, it is assigned a unique Client ID and Client Secret, which is used later when integrating with one of our APIs.

4 Subscribe to APIs

After registering your application, look through our API catalogue and find the one to suit your business needs, then request a subscription to an available plan.

Each plan determines the number of calls that your application can make within in a specific period. You can now integrate the API(s) with your app(s), website or business system.

Most subscription requests are subject to approval. Subscription requests for the Sandbox environment, can take up to a week; where requests for the production environment may take longer.

Practical example of subscriptions and API calls

Shall we call some APIs?

Sandbox Portal login – Step 1

Connect your firm with the EUIPO

The EUIPO Application Programming Interfaces (APIs) have been developed to let our customers integrate their systems to manage their intellectual property rights.
